Pyprococcal furfices and this produ. as a recombinet portes. 
In transformate using a vector carrying the protease game 
(AMPSHAI). A genomic to the sequence of the transformation is given in 
AVPSHAI and its encoded grotein in AMRS/09 streams.

This sequence represents coding sequence for the protease from 
Pyrococcus in the foreign by the coding sequence for the protease of the 
invention. The protease give an invention have extremely high thornal 
smothling in protease give an end as research research, and 
reduction the protease give and chemical industries.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    33

Hyperthermostable proteass fragment encoding DNA. AAX05920 standard: DNA; 1236 BP 06-MAY-1999 (first entry)

Myperthermostable; proteas:: thermophilis; becterium; subtilisin; additive: drug; washing agont; foodstuff; chemical synthesis; ds. Asada K, Kato I, Morishiga N, Shimojo T, Takakura H; 98WO-JP0245: (TAKI) TAKARA SHUZO CO LITT. 97JP-01519* Pyrococcus furiosus.

Recombinant hyperthermostable processe from Pyrococcus furlosus and gene encoding it, for Ease scale production of the protesse for hodustrial use.

```
New DNA sequence of thermophilic protein decomposition enzyme and protein derived therefrom .
P-PSDB; ABB09483
 SXCCXXXXXXXX
```

Claim 1, Page 6; 15pp; Korean.

This sequence represents the DNA encoding the Thermosaserobacter yonself subtilisin-like serine protesse of the invention. Sequence 2121 BP; 712 A; 410 C; 425 G; 554 T; 20 other;

This sequence topresents the protease from Thermococcus celer DSW-2476. This sequence is a protease of the investion, The processes of the invention have extremely high thermal stability. The processes can be used as repeatch resignits, and industrially in the food, drug and hemical industries.

ttt	T Asymmetric hydrolase gene derived from Streptomyose viridosporus. The arcts on "submittuded" 1-401 hydrolysidian derivatives to produce 1. The control derivatives aseful for synthesis of cardiowseniar drugs.
X S	Claim 1; Page 60-63; 78pp; Japanese.
ž88	This sequence is a fragment of an asymmetric hydrolase which arts on
388	the hydrolase (DhpA) was isolated from the chromosomal DNA of
388	Streptomyles withdospinus, The enzyme alions the entitient convecsion of 4-substituted-1,4-dihydropyridine esters to chiral partially hydrolysed destrotives, for use in the synthesis of cardiovascular-drugs
